

hooked

Tokens that enforce **their** **own rules.**

A launchpad on Solana where every token's trading rules are built into the token and checked on every trade, on any DEX.

hookedpad.com

Live on Solana mainnet

THE PROBLEM

Every launch promises fairness. **Nothing enforces it.**

Rules live on websites

Max-wallet limits, anti-bot checks and cooldowns sit in a launchpad's front end. Trade somewhere else and they're gone.

Bots win the first block

Bundlers and snipers take the supply before a person can click buy, then sell it back to them.

Every token is the same

One bonding curve, one behaviour. A creator can pick a name and a picture, and nothing about how the token actually trades.

THE IDEA

Put the rule inside the token.

Solana's Token-2022 standard lets a token call a program on every transfer: a **transfer hook**. If a trade breaks the rule, it never lands. Not on Hooked, not on Jupiter, not anywhere.

Any trade

A buy, a sell or a wallet-to-wallet send, on any DEX or aggregator.

The token's hook

Reads the trade, the clock, the pool, the transaction and the token's own history.

Allow or refuse

Enforced by Solana itself. No website, no keeper and no trust in the launchpad.

THE PRODUCT

39 hooks you can launch with today.

Max per wallet

Anti-bundle

Sniper-fee cap

Trade guard

Anti-dump caps

Graduated sell caps

Sliding caps

Conviction cap

Trading hours, any time zone

Market hours

Ping Pong

Hot potato

King of the Hill

Pegs

FOMO-only buys

Pump App only

OpenSea only

Blocklist

Allowlist

Holder vesting

Buyer rewards

Breathing cap

Momentum

Resonance

Custom hook (AI)

Editable hook

DAO hook

Combine rules

Each one is a real on-chain program, proven with live Meteora trades before it shipped. Launching takes two wallet approvals.

Say the rule. **AI writes the hook.**

"Max 1% per buy, wait 15 minutes after buying before you can sell, and only trade on weekdays in New York hours."

```
timezone America/New_York
refuse if is_buy and amount > 1%
refuse if is_sell and sender_seconds_since_buy < 15m
require is_transfer or (weekday < sat
                        and hour ≥ 9 and hour < 17)
```

How it stays safe

The AI can only write rule text. It compiles its own work with the real compiler, tests it against made-up trades, and shows the result in plain English.

The rule set is compiled to a tiny program with **no loops and no jumps**: it always finishes, and it can only allow or refuse.

One engine program runs every custom token, so a custom rule still **trades on any DEX**.

NEW

Rules that can change. **Run by AI.**

Editable hook

The rules are never locked. The creator tells the AI what to change, signs once, and the new rules are on-chain.

Only the creator's wallet can do it. Every change is public, with an optional notice period before it takes effect.

DAO hook

Holders run the token. Hold the minimum, post an idea, vote.

When an idea passes, the AI turns it into the hook and a keeper puts it on-chain. Nobody can change the rules any other way, not even the creator.

5% of each of these tokens' fees goes into its own fund, which pays for every change.

Every trade feeds the flywheel.

1% trading fee

On every Hooked bonding curve.
Creators take nothing from it.

85% buyback

The flywheel buys the Hooked
token on the market,
automatically, around the clock.

Burned

Everything it buys is burned.
Supply only goes down.

The other 15% funds development. Fees from graduated tokens keep flowing through the same loop for the life of the token.

Real tokens. Real volume.

682

tokens launched on
mainnet

3,305

SOL of trading fees
collected

2,808

SOL spent on buybacks

4.83%

of the Hooked token's
supply burned (48.2M
tokens)

Numbers as of 5 October 2026, all verifiable on-chain. The flywheel wallet and every burn are public.

We mapped the frontier before we built on it.

- **88 batches of experiments.** Every transfer-hook capability built as a small program and run on devnet with live Meteora swaps, results written down whether it worked or not.
- **We found what makes a hook token tradable everywhere,** and what breaks it. That is why most Hooked tokens work on any DEX.
- **Things nobody had shown:** per-wallet history for 100,000 traders in one account, tokens that react to other tokens, a hook that runs a game and pays its winner.
- **Ships fast.** New hooks go from idea to mainnet in a day, after passing on devnet with real trades.

hooked

The rule is **the** **token.**

Next: more hooks from the community's ideas board, and
balance-weighted DAO votes.
